

SOLUTIONS TO S.6 PHYSICS P1 REVISION QNS (26th JUNE 2020)

<p>1(a)(i)</p>	 <p>Suppose that in time t, a particle moves from A to B along a circle of centre O. The radius OA sweeps through angle θ, in radians.</p> <p>The angular velocity, $\omega = \frac{\theta}{t}$ (1) ✓</p> <p>The period, T, is the time taken to describe the circle once.</p> <p>Thus, using equation (1) $\omega = \frac{2\pi}{T}$</p> <p>$\therefore T = \frac{2\pi}{\omega}$ (2) ✗</p> <p>If r is the radius of the circle, then the tangential velocity, $v = \frac{2\pi r}{T}$ ✗</p> <p>Substituting for T from equation (1), we have that</p> <div style="border: 1px solid black; display: inline-block; padding: 2px;"> $v = r\omega$ </div> <p>✓</p>	<p>1</p> <p>1/2</p> <p>1/2</p> <p>1</p>
	<p>(ii) The frictional force provides the centripetal force on the coin</p> <p>$\therefore m\omega^2 = \mu mg$ ✓</p> <p>$r(2\pi f)^2 = \mu g$ ✗</p> <p>$\therefore f = \frac{1}{2\pi} \sqrt{\frac{\mu g}{r}}$ ✗</p> <p>$= \frac{1}{2\pi} \sqrt{\frac{0.5 \times 9.8}{5 \times 10^{-2}}} = 1.58 \text{ Hz}$ ✓</p>	<p>1</p> <p>1/2</p> <p>1/2</p> <p>1</p>
<p>(b)</p>	<p>(i) ...the work done in moving a mass of 1 kg from infinity to a point. ✓</p> <p>(ii) Total energy, $E = \text{p.e} + \text{k.e}$ ✓</p> $= \frac{-GMm}{R} + \frac{1}{2}mv^2$ <p>But $\frac{mv^2}{R} = \frac{GMm}{R^2}$, the centripetal force</p>	<p>1</p> <p>1</p> <p>1</p>

	$\therefore \frac{1}{2}mv^2 = \frac{GMm}{2R}$ $\therefore E = \frac{-GMm}{R} + \frac{GMm}{2R} = \frac{-GMm}{2R}$	✓ ✓	1
	<p>(iii) Due to friction in the Earth's atmosphere, the satellite energy decreases and consequently it falls to an orbit of smaller radius, say r_1.</p> <p>So its total energy changes from $\frac{-GMm}{2r_0}$ to $\frac{-GMm}{2r_1}$</p> <p>In particular its kinetic energy changes from $\frac{GMm}{2r_0}$ to $\frac{GMm}{2r_1}$</p> <p>Since $r_1 < r_0$, the final kinetic energy is greater. So the satellite speeds up and may heat up and even burn unless precautions are taken.</p>	✓ ✓ ✓ ✓	1 1 1 1
(c)	<p>(i) ...the motion of a particle whose acceleration is directed towards a fixed point in its path and is directly proportional to the particle's displacement from that point. ✓</p>		1
	<p>(ii) Let k = constant of the combination When a force, say F, is applied to the combination, the total extension,</p> $e = \frac{F}{k} = \frac{F}{k_1} + \frac{F}{k_2} \quad (\text{the springs experience the same force})$ $\therefore k = \frac{k_1 k_2}{k_1 + k_2}$  <p>Suppose that at an instant, m is at a displacement x from the equilibrium position, O. Then, if a is the acceleration of m, considered positive away from O, we have that</p> $ma = -kx$ $\therefore a = -\frac{k}{m}x$ <p>The negative sign means that the acceleration, a, is towards a fixed point O; and since k and m are constant, it follows that $a \propto x \Rightarrow$ simple harmonic motion.</p> <p>The expression may be written as</p> $a = -\omega^2 x, \quad \text{where } \omega = \sqrt{\frac{k}{m}} = \text{angular frequency}$ <p>If T is the period, $\omega = \frac{2\pi}{T}$</p> $\therefore \frac{2\pi}{T} = \sqrt{\frac{k}{m}}$	✓ ✓ ✓ ✓ ✓ ✓ ✓ ✓	$\frac{1}{2}$ 1 $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$

	$\therefore T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{m(k_1 + k_2)}{k_1 k_2}}$ ✓	1
--	---	---

Total = 20

2 (a)	(i) ... the heat flow rate per unit area per unit temperature gradient. ✓	1
-------	---	---

	(ii) In metals conduction is predominantly due to freely moving electrons (in addition to lattice vibration). ✓	1
	When a part of a metal is heated, the free electrons gain thermal energy and their velocities increase. ✓	1
	They distribute this energy by collision with positive ions in the lattice and increase the ions' vibrational energy. ✓	½
	Because electrons are light, they are able to move quickly to the cooler parts of the solid. ✓	½

(iii)	 <p style="text-align: center;">Tubular copper coil</p>	1 ✓
-------	--	-----

	The specimen XY is long compared with its diameter. All this is aimed at achieving a steep temperature gradient with a measurable heat flow rate. ✓	1
	- The diameter of the bar is measured to determine its cross-sectional area, A, and the apparatus is set up as shown. ✓	½
	- To measure the temperature gradient, thermometers are placed in holes C and D bored in the bar at a measured distance, l, apart. These holes are filled with mercury for good thermal contact. ✓	½
	- The specimen is heated at end X while it is cooled by circulating water at Y. The setup is kept running until all the temperatures have become steady and they are measured. ✓	1
	- Then the cooling water circulating is collected over a measured time interval and the mass of it, m, flowing per second is found. ✓	½

Calculations:
Let k = thermal conductivity of the specimen

	<p>Then the heat flow rate, $q = \frac{kA(\theta_2 - \theta_1)}{l}$ ✓</p> <p>This heat is carried away by the cooling water. If c_w is the specific heat capacity of water, then</p> $\frac{kA(\theta_2 - \theta_1)}{l} = mc_w(\theta_4 - \theta_3)$ ✓ <p>∴ $k = \frac{mc_w(\theta_4 - \theta_3)l}{A(\theta_2 - \theta_1)}$</p>	<p>½</p> <p>1</p>
--	--	-------------------

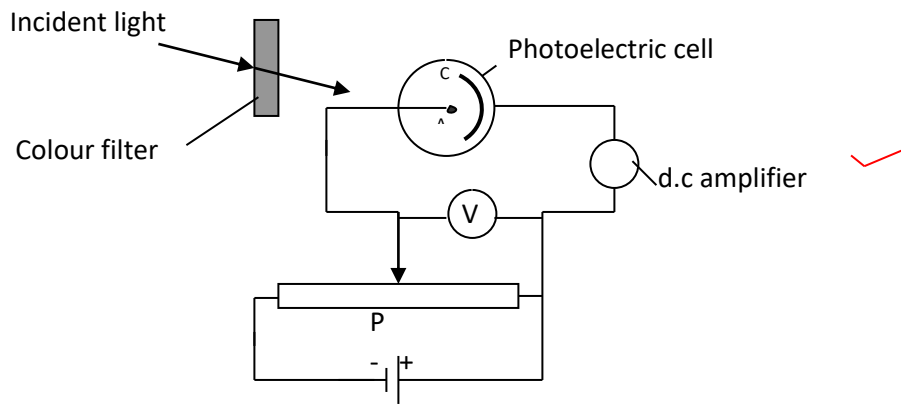

(b)	<p>(i) ...a body which absorbs all radiation falling on it, without reflecting or transmitting any of it. ✓</p>  <p style="color: red; border: 1px solid red; border-radius: 15px; padding: 5px; display: inline-block;">The axes must be labelled and the temperatures compared</p>	<p>1</p> <p>2</p>
-----	---	-------------------

(ii)	<p>At first the ball is invisible. ✓</p> <p>It becomes dull red, then bright red and finally less red tending to white. ✓</p> <p>This is because, as the temperature rises, the intensity of the shorter wavelength increases more rapidly. ✓</p> <p>So the peak intensity shifts from the red end of the spectrum into the visible spectrum, which is a narrow band. ✓</p>	<p>½</p> <p>1</p> <p>1</p> <p>½</p>
------	---	-------------------------------------

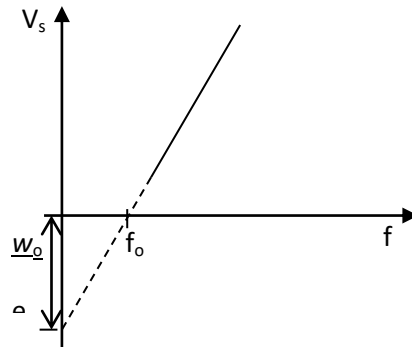

(c)	When the temperature is steady	
-----	--------------------------------	--

	<p>Power radiated by the filament = power generated</p> <p>$\therefore 0.85\sigma AT^4 = 1800$</p> <p>$\therefore T^4 = \frac{1800}{0.85\pi dl\sigma} = \frac{1800 \times 10^8}{0.85 \times 1.5 \times 10^{-2} \times 0.3 \times 5.7}$</p> <p style="text-align: center;">= 1273 K</p>

3 (a)	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">X-RAYS</th> <th style="width: 50%; text-align: center;">CATHODE RAYS</th> </tr> </thead> <tbody> <tr> <td>Electromagnetic waves produced when a metal is struck by high-energy electrons</td> <td>A stream of fast-moving electrons accelerated by a p.d.</td> </tr> <tr> <td>Carry no charge</td> <td>Carry negative charge</td> </tr> <tr> <td>Not affected by magnetic or electric fields</td> <td>Deflected by both magnetic and electric fields</td> </tr> </tbody> </table> <p style="text-align: center; border: 1px solid red; border-radius: 15px; padding: 5px; margin: 10px auto; width: fit-content;"><i>Take the first one and any other @1</i></p>	X-RAYS	CATHODE RAYS	Electromagnetic waves produced when a metal is struck by high-energy electrons	A stream of fast-moving electrons accelerated by a p.d.	Carry no charge	Carry negative charge	Not affected by magnetic or electric fields	Deflected by both magnetic and electric fields	2
X-RAYS	CATHODE RAYS									
Electromagnetic waves produced when a metal is struck by high-energy electrons	A stream of fast-moving electrons accelerated by a p.d.									
Carry no charge	Carry negative charge									
Not affected by magnetic or electric fields	Deflected by both magnetic and electric fields									
	<p>(ii) At the target more than 99% of the bombarding electrons' energy is converted into heat. ✓</p> <p>So the target is made of tungsten with a high melting point ✓</p> <p>The target is fitted in a thick anode made of copper so as to conduct away the heat as efficiently as possible. ✓</p> <p>To better the cooling process a liquid circulates in passages made in the anode block and the anode ends in fins outside. ✓</p>	1 1 1 1								
(b)	<p>(i) When a parallel beam of X-rays of wavelength λ falls on a crystal lattice of interatomic spacing d at a glancing angle θ, reinforcement of the reflected beam occurs only when</p> <p style="text-align: center;">$2d\sin\theta = n\lambda$, where n is an integer ✓</p>	1								
	<p>(ii) λ must be small compared to $2d$ ✓</p>	1								
	<p>(iii) The maximum order will be investigated by first making $\sin\theta = 1$ ✓</p> <p>$\therefore n = \frac{2d}{\lambda} = \frac{2 \times 3.00 \times 10^{-10}}{1.187 \times 10^{-10}} = 5.05$ ✓</p> <p>So the maximum order is 5 ✓</p>	1 1 1								
(c)	<p>(i) ...the minimum energy of incident light that will eject an electron from the metal surface concerned. ✓</p>	1								

(ii)

- The circuit is connected as shown in which P is a potential divider.
- Using different colour filters, the frequency, f , of the incident light is varied.
- For a given frequency the p.d V , picked from the potential divider P, is varied negatively until the current registered by the d.c amplifier just becomes zero.
- The reading of the voltmeter is noted and it is the stopping potential, V_s , for the frequency f .
- The procedure is repeated using different colour filters, each time noting the corresponding stopping potentials V_s .
- A graph of V_s against f is plotted. A graph of V_s against f is plotted.

From $V_s = \frac{h}{e}f - \frac{\omega_0}{e}$, the gradient of the graph is $\frac{h}{e}$
 $\therefore h = e \times \text{gradient}$

(iii) $\omega_0 = hf_1 - eV_1$ (1)

and $\omega_0 = hf_2 - eV_2$ (2)

Eq(1) x f_2 : $\omega_0 f_2 = hf_1 f_2 - eV_1 f_2$ (3)

Eq(2) x f_1 : $\omega_0 f_1 = hf_1 f_2 - eV_2 f_1$ (4)

Eq(3) - Eq(4): $\omega_0(f_2 - f_1) = eV_2 f_1 - eV_1 f_2$

$$\therefore \omega_0 = \frac{e(V_2 f_1 - V_1 f_2)}{f_2 - f_1} = \frac{1.6 \times 10^{-19}(2.2 \times 6 - 0.6 \times 10)}{10 - 6} = 2.88 \times 10^{-19} \text{ J}$$
